QM:Work Instructions

Use this template to create "action points" in other wiki pages, such as meeting minutes. For each "action point", a semantic subobject is created, which has its own property values. This allows to query e.g. all open action points for a specific user or from a specific namespace or subpage.

Create tasks, e.g. during meetings

Template parameters

Parameter		Description	Type	Status
Who?	<input type="text" value="apname"/>	Who needs to complete the task?	User	required
